# Uncertainty Quantification with Python

Scientific Machine Learning with UQpy

Connor Krill, Ponkrshnan Thiagarajan, Georgios Pasparakis, Somdatta Goswami, Dimitris Giovanis, Michael Shields  
Department of Civil & Systems Engineering

# Agenda

---

- What is UQpy?
- Software Design
- Scientific Machine Learning
  - Layers
  - Network Architecture
  - Training Methods

**UQpy** is a Python package where you define the **model**, and then we handle the **Uncertainty Quantification**.

# UQpy Modules

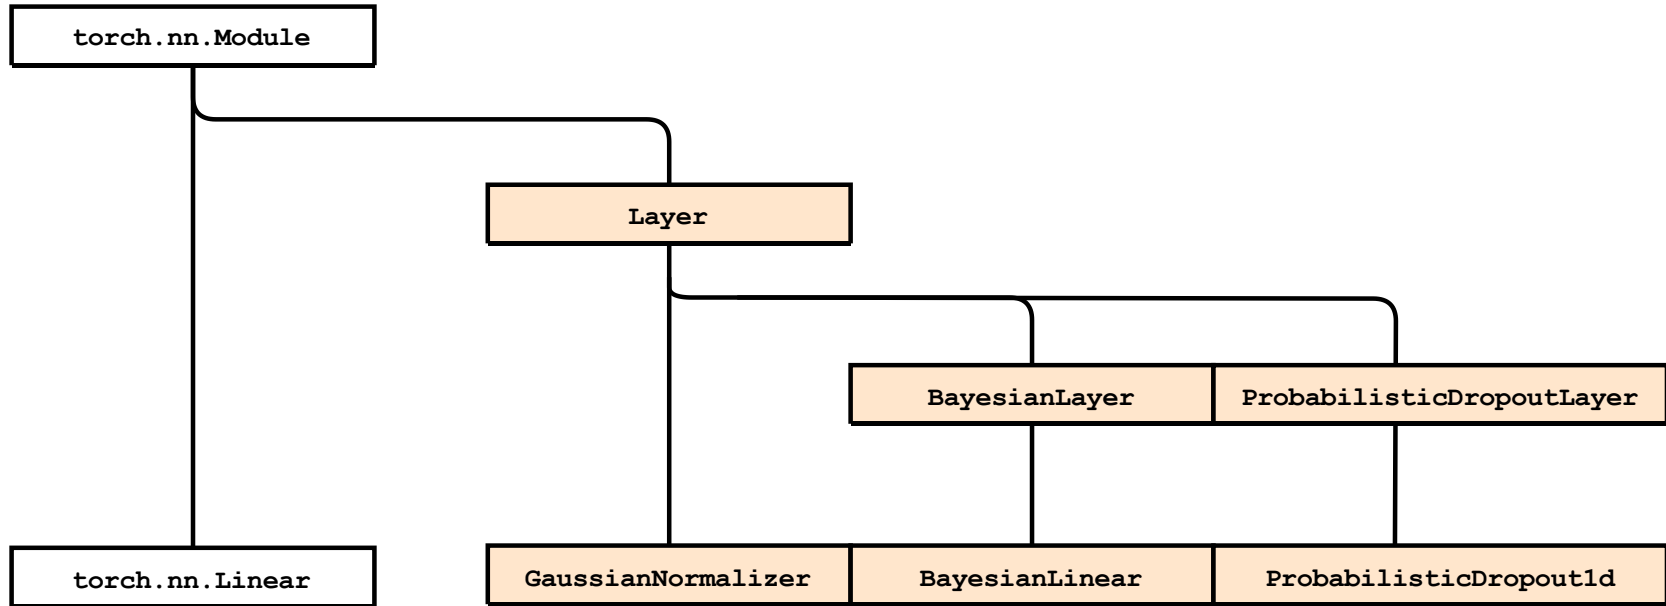

- Dimension Reduction
- Distributions
- Inference
- Reliability
- Run Model
- Sampling
- Scientific Machine Learning
- Sensitivity
- Stochastic Processes
- Surrogates
- Transformations

**UQpy** uses hierarchical classes to create a **modular structure** for **simple customization**.

# UQpy: Scientific Machine Learning

- Incorporates UQ into PyTorch models
- Bayesian versions of Linear, Convolutions, and more!
- Architecture for Neural Operators
- Methods to train neural networks

# UQpy: Scientific Machine Learning

This module enables the **expansion of existing models** and the **rapid development of new research**.

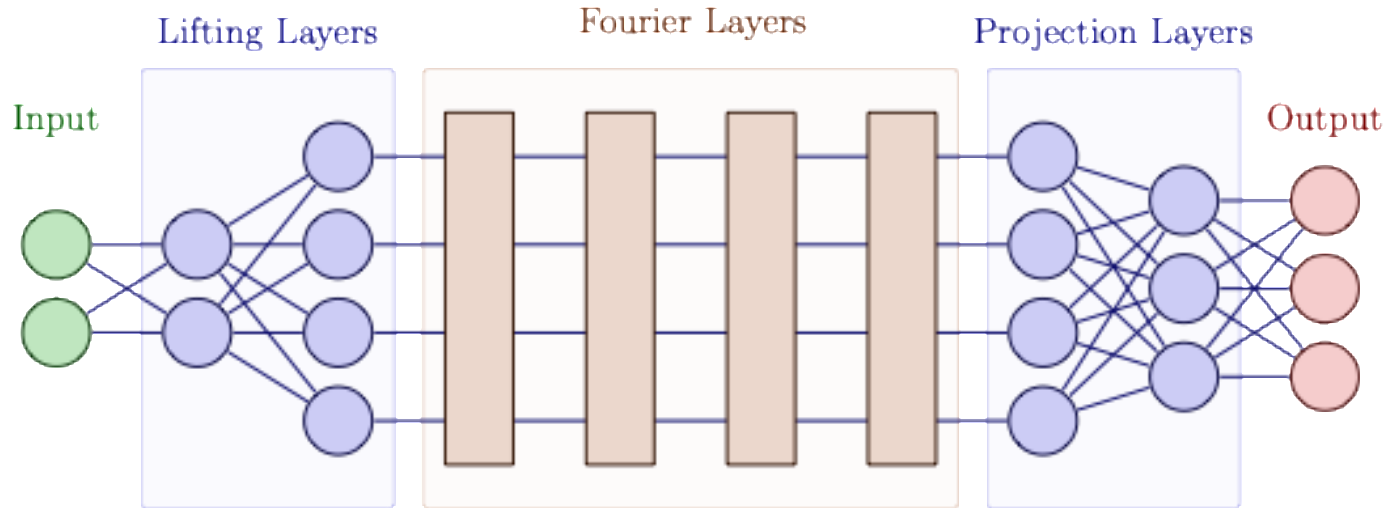

# SciML: Extending Existing Models

```
1 deterministic = nn.Sequential(  
2     nn.Linear(2, 10),  
3     nn.ReLU(),  
4     nn.Linear(10, 10),  
5     nn.ReLU(),  
6     nn.Linear(10, 5),  
7 )
```

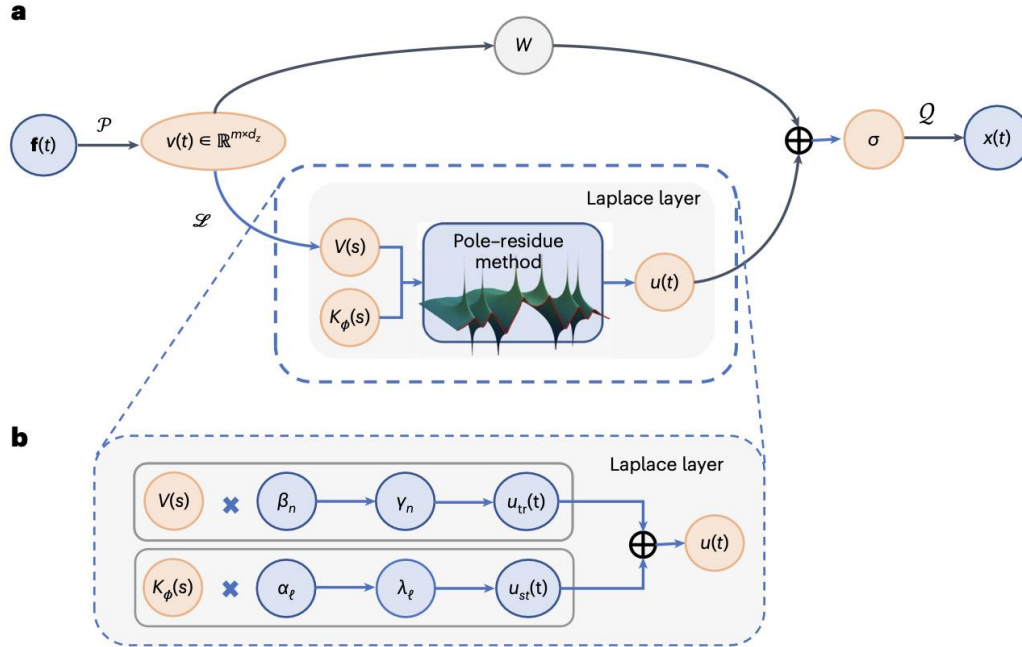

```
1 bayesian = nn.Sequential(  
2     sml.BayesianLinear(2, 10),  
3     nn.ReLU(),  
4     nn.Linear(10, 10),  
5     nn.ReLU(),  
6     sml.BayesianLinear(10, 5),  
7 )
```
